

PROJECT EOTS

PROJECT EOTS is a high level 2 axis gimbal system, its capable of tracking targets with Open-cv running externally, its actuated by two powerful brushless motor, the payload is a dual band cameras meaning you can see visible light and thermal light. To maintain absolute freedom of movement during high-speed tracking, the payload is mounted to a rugged, custom-engineered yoke chassis designed for full 360° continuous rotation. This mechanical assembly completely eliminates wire binding.

A custom made dual-axis brushless motor controller implementing Field Oriented Control (FOC) algorithms paired with high-precision AS5048A magnetic encoders. Engineered specifically for continuous, ultra-smooth 360° stabilization and dynamic target tracking loops

STM32-F405
